INTRODUCTION

DEVOPS AT GMV: ADAPTABILITY

BENEFITS OF DEVOPS: COVID-19

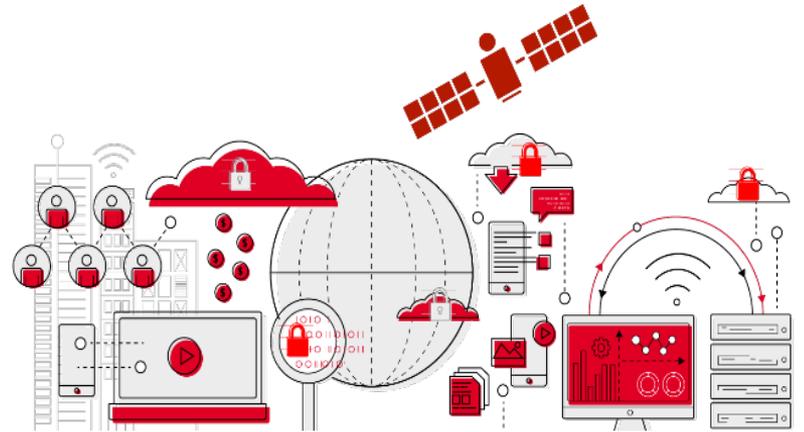

Introduction

Experience at the GMV Control Centers Business Unit

In particular in the Eutelsat section

- Also some relevant experiences from other areas
- Agile approach for implantation

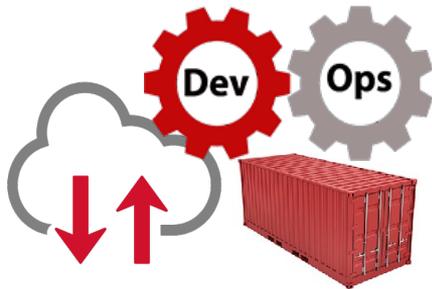

Relying on DevOps practices to handle new situations and challenges

Understanding DevOps

Len Bass, Ingo Weber, and Liming Zhu—*three computer science researchers from the CSIRO* and the Software Engineering Institute*—suggested defining DevOps as:

"a set of practices intended to **reduce the time** between committing **a change** to a system and the change being placed into normal **production**, while ensuring **high quality**"

** Commonwealth Scientific and Industrial Research Organisation (CSIRO) is an independent Australian federal government agency responsible for scientific research*

Main PILARS

■ (No) implication of **Team Members**

- Motivation/Compromise
- Classical roles/Egos

CULTURE

■ (Undesired) **Software Quality**

- Manual intervention
- Low level of testing

AUTOMATE

■ (Static) **Processes/Procedures**

- Lack of improvements

MEASURE

■ (No) **Feedback** from final users

- Unknown real expectations

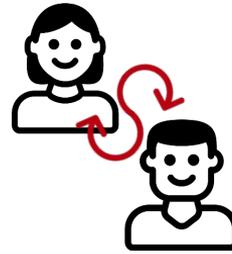

SHARE

ADAPTABILITY

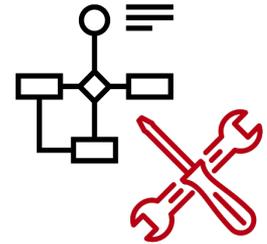

GMV Experience: CULTURE

- Initially we saw a lack of **tools and processes**
- But then we identified a problem a **culture**

- Training, coaching, workshops, ...
- Need to believe in the change
- **Motivation and Compromise**

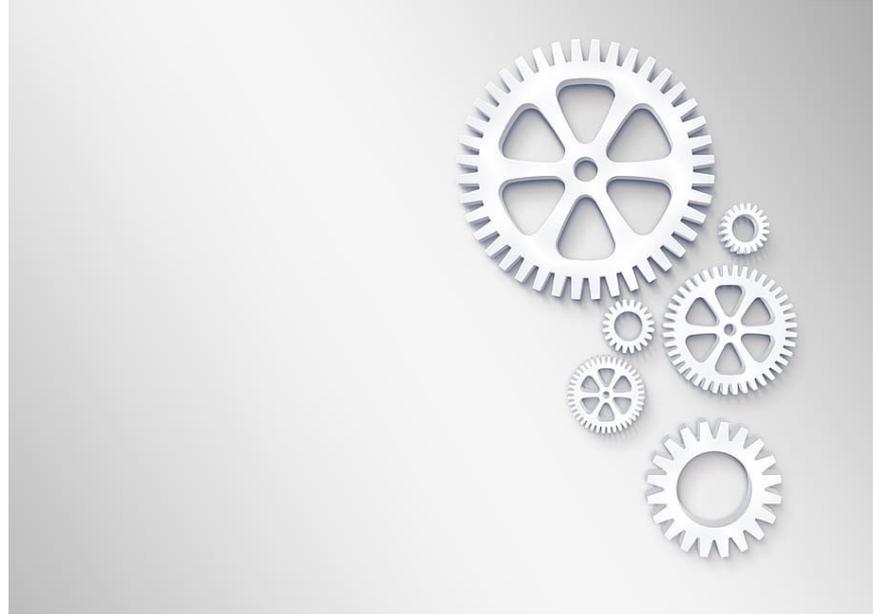

VS

- New **AGILE** approach:
 - New multidisciplinary and self-organized teams
 - New roles: Product Owners (at GMV), Scrum Masters but classical Project Managers
- Usage of **SCRUM** and/or **KANBAN**

GMV Experience: AUTOMATE

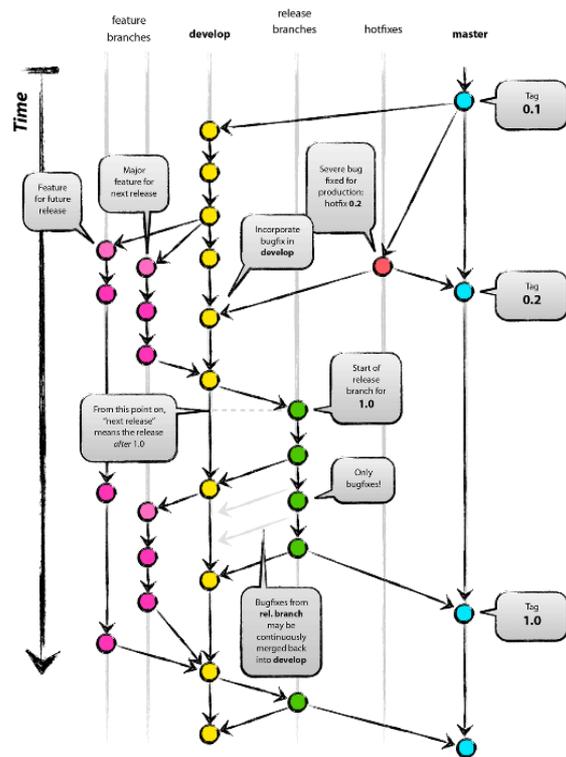

- Code Production
- Build/Release Generation
- Validation and Testing
- Deployment

GMV Experience: AUTOMATE

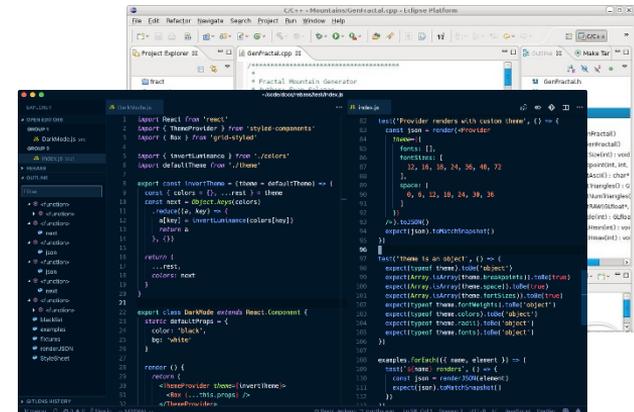

CODE PRODUCTION

- From SVN repository to a **GIT**
 - Repository located at **customer premises**
 - Huge improvement in merges and release generation
 - Usage as **Git Flow** as higher layer
- Development in separate **features (US)**
 - Improved testing and validation
 - Better integration

GMV Experience: AUTOMATE CODE PRODUCTION

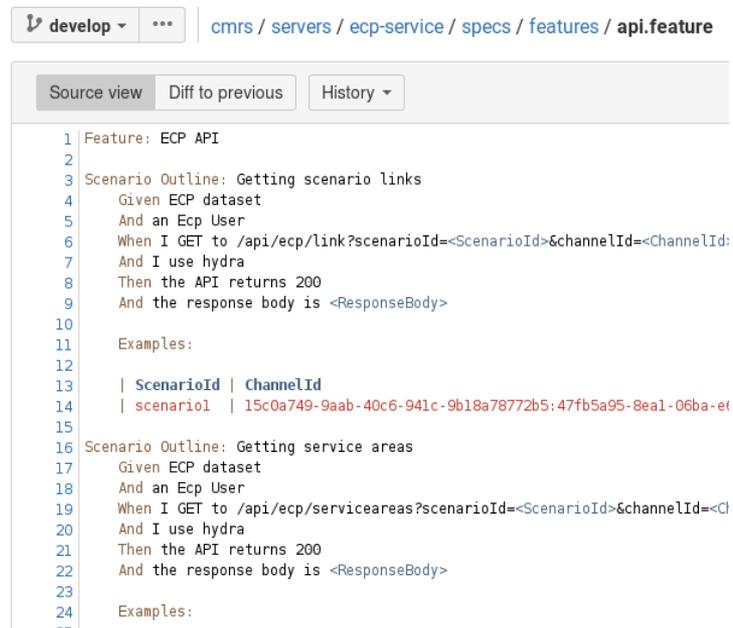

- Introduction of **Atlassian Tools**:
JIRA/Confluence/Bitbucket/Bamboo
 - Excellent integration
 - Focused on Agile
- Other tools to help developers
 - Development IDEs
 - Integration of dependencies, style, metrics

GMV Experience: AUTOMATE

CODE PRODUCTION

- User Stories have a common Definition of Done (**DoD**)
 - Code controlled and reviewed
 - Test cases passed
 - ... and other activities project dependent
- But a particular **Acceptance Criteria**
 - Defined and validated by the Product Owner

```
develop | cmrs / servers / ecp-service / specs / features / api.feature

Source view | Diff to previous | History ▾

1 Feature: ECP API
2
3 Scenario Outline: Getting scenario links
4   Given ECP dataset
5   And an Ecp User
6   When I GET to /api/ecp/link?scenarioId=<ScenarioId>&channelId=<ChannelId>
7   And I use hydra
8   Then the API returns 200
9   And the response body is <ResponseBody>
10
11 Examples:
12
13 | ScenarioId | ChannelId
14 | scenario1 | 15c0a749-9aab-40c6-941c-9b18a78772b5:47fb5a95-8ea1-06ba-ef
15
16 Scenario Outline: Getting service areas
17   Given ECP dataset
18   And an Ecp User
19   When I GET to /api/ecp/serviceareas?scenarioId=<ScenarioId>&channelId=<ChannelId>
20   And I use hydra
21   Then the API returns 200
22   And the response body is <ResponseBody>
23
24 Examples:
25
```

GMV Experience: AUTOMATE

BUILD GENERATION

- Builds managed by **Bamboo**
 - Incremental, Nightly
 - Automatic after commit
 - Execution of tests
 - Deployment of artifacts
 - Configuration (Ansible)

- Significant effort for **reducing the build generation time**
 - Improvement of our own build systems
 - New compilers (i.e. clang for C++)
 - Parallelization and distribution

GMV Experience: AUTOMATE

VALIDATION AND TESTING

- **Automatic testing** considered a pillar of the process
- Automation in **unit**, **integration** and **system** tests
- In progress
 - **TDD** – Test Driven Development
 - **BDD** – Business Driven Development
 - Huge effort for introducing automatic tests in **legacy code** (refactoring)
- **Validation across the sw. development life cycle:**
 - Before control changes → GIT pre-hook for checking **metrics**
 - After control changes → **Code review** process (pull requests) + **Metrics** (coding & security)
 - Build generation → Execution of test cases (**unit test**)
 - Deployed system → Execution of **integration test** cases + **Cross validation** process
 - Staging environment → Automatic **end-to-end** tests
 - Customer **demo**

GMV Experience: AUTOMATE

VALIDATION AND TESTING

■ Involved tools

– Metrics

- SonarQube, CppCheck, CppLint, Checkstyle, Formatter, Gcov, Covertura,

– Bitbucket

- Code Review
- Integration of Metrics

– Testing framework

- Xray: manual and automatic tests

– Testing tools

- Google Test, Junit, Jest, Mockito, Cucumber, ...
- Robot Framework, procedure automation tool

GMV Experience: SHARE

- Feedback from Product Owners → Demo
- Feedback from Customer → Docker containers
- *Continuous deployment* at customer facilities
 - Microservices
 - Refactoring of legacy systems
 - Acceptance/Validation environment
 - Ready for operation deployment
- From staging to **operational** platform managed by Eutelsat
 - Automatic build deployment
 - Manned activation (with seconds of downtime)

GMV Experience: MEASURE

- Deployment effort:
 - from 1000 hours per year to 200 hours
- Defects reported to customer:
 - 25% with respect to before introducing Agile/DevOps
- Others:
 - Code coverage (depends on project nature)
 - Team efficiency (velocity, sprint review, motivation)
 - Improvements (sprint retro and retro of retros)
 - **Customer satisfaction**

DevOps Benefits: COVID-19

- DevOps critical for COVID-19
- Nominal activity at GMV continued with minin
 - **ENVIRONMENTS** adapted:
 - Remote access. Powerful corporative infrastructure
 - Dockers containers for project resources
 - NoMachine for accessing remotely to particular environments
 - **TEAM:**
 - Scrum Ceremonies already integrated in the workflow
 - Team communication and coordination

DevOps Benefits: COVID-19

- Nominal activity at GMV continued with minimal impact.
 - **SW Efficiency with QUALITY**: automation in place
 - Ms Teams, IDE Clion, JIRA tools and plugins, ...
 - Collaboration, Remote Pair programming
 - Mature environments with a high level of automation
 - Development model based on testing
 - Uninterrupted **DELIVERY** and customer **feedback**
 - Remote demos
 - Scheduled meetings and milestones

GMV Experience: CHALLENGES

- How to deal with a flexible development with a **fixed price** and **fixed schedule** project:
 - Agile Contract
- Deal with other non-yet-agile entities
- Keep customer collaboration
- Keep motivated teams
- Keep improving the efficiency from development to delivery
